Not illustrated. 1827 Excerpt: . . . force sustained by A D, and D f that sustained by B D. 155. 1 We may farther suppose the weight C to act upon the point D by pressure, as in fig. 3, instead of being suspended, as in the former cases. But it is evident, that if C D is perpendicular to the horizon, the weight C acting upon the point D in the same direction, and with the same force, as if suspended as in the last case, must require the same force to be exerted by A D and B D to sustain it. If therefore we wish to know what force each of the supports, A D and B D, will have to sustain, in consequence of the pressure of the weight C, we have only to draw the vertical line D e, of a convenient length to represent the weight C, and then from the point e to draw e f parallel to A D; and as in the former case, e f will represent the force, which must be exerted by A D; and D f that which must be exerted by D B. 156. From these two last examples, we may infer, that if any force act upon a point, it may be balanced by any two other forces acting upon the same point, provided the three forces are proportional to the three sides of any triangle, and act in directions parallel to those sides. . 157. It..
